

The OpenAI/Anthropic/SpaceX IPO means, it's time to ensure that your AI engineering innovations survive

If you work in the AI industry, it's time to preserve the engineering innovations you built – before the risk of a bursting bubble skyrockets.

- Did you build libraries to efficiently analyze specific data formats?
- Did you work on lean and fast serialization?
- Did you create optimizing orchestration tools for GPU-bound tasks with dependencies?
- ...

... then please try to get them released as [FOSS](#)!

That way you ensure that even if the bubble bursts, the fruits of your labor will survive and their legacy can improve software for decades to come.

The IPOs either mean that all three increase the intensity of their competition, or that the owners want to turn their companies' evaluation into lasting wealth before the AI bubble bursts.
